

**VAGUE REGULAR GENERALIZED - INT AND VAGUE REGULAR GENERALIZED - NBD IN TOPOLOGICAL SPACES****D. Poongodi** Research Scholar, Bharathiar University pg Extension and Research Centre, Erode.**S. Bharathi** Assistant Professor, Department of mathematics, Bharathiar University pg Extension and Research Centre, Erode.**Abstract:**

The purpose of this study is to investigate a novel class of vague regular α generalized interior in vague topological spaces and some of their characterizations are obtained. Further, we introduced and studied vague regular α generalized neighborhood in vague topological spaces. Also several properties were discussed.

1. Introduction

To address the ambiguity, several generalizations of vague sets have been achieved. In 1970 [5], Levine proposed the idea of generalized closed sets and covered topics such as connectedness, set attributes, closed maps, open maps, and separation axioms. In topological spaces H. Maki, K. Balachandran, and R. Devi [6] introduce the notion of α generalized closed sets. In recent years, many researchers like, Arockiarani, Maria presenti [7], Amarendra babu, Ahmed allam and Ramarav[8] have worked on vague topological spaces. Bharathi. S, Poongodi.D introduced a new class of generalized closed sets in vague topological spaces in 2022. This paper, explores the notion of VR G -interior (VR g -Int) and VR G -neighbourhood (VR G -Nbd) in vague topological spaces. The basic properties and some characterizations are obtained. Throughout this paper, we have considered X_v, Y_v as vague topological spaces. Let $A_v \subseteq X_v$, the closure and the interior is denoted by $Cl(A_v)$ and $Int(A_v)$ respectively. Here a vague regular alpha generalized interior and vague regular alpha generalized closure are defined as follows $\{E: E \text{ is a VR GOS and } E \subseteq Int(A_v)\}$ and $\{F: F \text{ is a VR GCS and } A_v \subseteq F\}$.

2. Preliminaries

Definition 2.1: [4] Consider the universe X_v . A vague set is defined by $A_v = \{x \in X_v : t_{A_v}(x), f_{A_v}(x)\}$ where a true membership function ($t_{A_v}(x)$) and a false membership function ($f_{A_v}(x)$) are used to represent $t_{A_v}(x)$ and $f_{A_v}(x)$ respectively. The "evidence for x " is used to derive the lower constraint on the grade of membership of x , which is denoted by $t_{A_v}(x)$. The "evidence against x " is used to determine the lower bound on the negation of x , which is $f_{A_v}(x)$. As a result, a subinterval of $[0,1]$ defines the grade of membership of x in A_v . This states that if the actual grade of membership is $\mu_v(x)$, then $t_{A_v}(x) \leq \mu_v(x) \leq f_{A_v}(x)$ and $t_{A_v}(x) + f_{A_v}(x) \leq 1$.

Definition 2.2: [8]

- i) A VRCS (vague regular closed set) if $A_v = VCl(VInt(A_v))$.
- ii) A VCS (vague α closed set) if $VCl(VInt(VCl(A))) \subseteq A_v$.
- iii) A VGCS (vague generalized closed set) if $VCl(A_v) \subseteq U_v$ when $A_v \subseteq U_v$.
- iv) A VGSCS (vague generalized semi closed set) if $VsCl(A_v) \subseteq U_v$ when $A_v \subseteq U_v$.
- v) A VGPCS (vague generalized pre closed set) if $VpCl(A_v) \subseteq U_v$ when $A_v \subseteq U_v$.

Definition 2.3: [7, 9]

- i) A VGCS if $VCl(A_v) \subseteq U_v$ when $A_v \subseteq U_v$.
- ii) A VRGCS if $VCl(A_v) \subseteq U_v$ when $A_v \subseteq U_v$.

Definition 2.4: [3]

A VR GCS (vague regular generalized closed set) if $VCl(A_v) \subseteq U_v$ when $A_v \subseteq U_v$ and U_v is VROS in X_v . The compliment of VR GCS is VR GOS (vague regular generalized open set)

Definition 2.5: [2]

A map $f: (A, \tau) \rightarrow (B, \sigma)$ is called a VR G continuous map if $f^{-1}(F)$ is a Vr GCS in (A, τ) for every VCS (vague closed set) F of (B, σ) .

3. Vague regular generalized neighbourhood of a vague point (VR G - Nbd)

Definition 3.1: Let N_v be a subset of vague topological space X_v and a vague point $x_v \in X_v$. A subset N_v is said to be a VR G - Nbd of a vague point x_v iff there exists $\alpha \in (0, 1)$ such that $N_v \in \text{VR}\alpha\text{GOS}(x_v)$.

Definition 3.2: Let N_v be a subset of a vague topological space X_v , is called a VR G - Nbd of $A_v \subseteq X_v$ iff there exists $\alpha \in (0, 1)$ such that $N_v \in \text{VR}\alpha\text{GOS}(A_v)$.

Remark 3.3: The VR G - Nbd of vague point $x_v \in X_v$ need not be a VR G open in X_v .

Theorem 3.4: Every Nbd N_v of vague point $x_v \in X_v$ is a VR G - Nbd of X_v .

Proof: Consider the vague topological space X_v of Nbd N_v and a vague point $x_v \in X_v$. Then an open set G_v so as $x_v \in G_v \subseteq N_v$. Since every open set is $\text{VR}\alpha\text{GOS}$ G_v so as $x_v \in G_v \subseteq N_v$. Therefore, N_v is VR G - Nbd of x_v .

Remark 3.5: VR G - Nbd N_v of x_v be a Nbd of x_v in X_v is need not be in general.

Theorem 3.6: If N_v is VR G open, then N_v is a VR G - Nbd of each of its points.

Proof: Let us assume that N_v is $\text{VR}\alpha\text{GOS}$ and $x_v \in N_v$. We assert that N_v is a VR G - Nbd of x_v . Because N_v is a VR GOS so as $x_v \in N_v \subseteq N_v$. Hence N_v is a VR G - Nbd of each of its points. Since the arbitrary point x_v is in N_v .

Theorem 3.7: Consider the vague topological space X_v . If F_v is a vague regular generalized closed subset, $x_v \in F_v$. Then a VR G -Nbd N_v of x_v such as $N_v \subseteq F_v$.

Proof: Consider a vague regular generalized closed subset F_v of X_v , $x_v \in F_v$. Therefore, F_v is VR GOS of X_v . By previous theorem we have $F_v \subseteq \text{VR G -Nbd}$ of each of its points. Then a VR G -Nbd N_v of x_v such as $N_v \subseteq F_v$. i.e, $N_v \subseteq F_v$.

Definition 3.8: Consider a vague point x_v in X_v . The VR G -Nbd system at x_v is the collection of all VR G -Nbd, and it is represented by the symbol $\text{VR G -Nbd}(x_v)$.

Theorem 3.9: Consider the vague topological space X_v . Let $\text{VR G -Nbd}(x_v)$ be the collection of all VR G -Nbd of x_v and for each $x_v \in X_v$ The results are as follows. (i) $\forall x_v \in X_v, \text{VR}\alpha\text{G -Nbd}(x_v) \neq \emptyset$.

(ii) $N_v \in \text{VR G -Nbd}(x_v) \Rightarrow x_v \in N_v$.

(iii) $N_v \in \text{VR G -Nbd}(x_v), M_v \subseteq N_v \Rightarrow M_v \in \text{VR G -Nbd}(x_v)$.

(iv) $N_v \in \text{VR G -Nbd}(x_v), M_v \in \text{VR G -Nbd}(x_v) \Rightarrow N_v \cap M_v \in \text{VR G -Nbd}(x_v)$.

(v) $N_v \in \text{VR G -Nbd}(x_v) \Rightarrow$ there exists $M_v \in \text{VR G -Nbd}(x_v)$ such that $M_v \subseteq N_v$ and $M_v \in \text{VR G -Nbd}(y_v)$ to each $y_v \in M_v$.

Proof: (i) As X_v is a VR G open set, every $x_v \in X_v$ is a VR G -Nbd of X_v . Hence, for each $x_v \in X_v$, there exists at least one VR G -Nbd (specifically, X_v). Hence, for every $x_v \in X_v, \text{VR G -Nbd}(x_v) \neq \emptyset$.

(ii) N_v is a VR G -Nbd of x_v , if $N_v \in \text{VR G -Nbd}(x_v)$. Hence by the definition VR G - Nbd, $x_v \in N_v$.

(iii) Let $N_v \in \text{VR G -Nbd}(x_v)$ and $M_v \subseteq N_v$. A VR G open set G_v follows, such as $x_v \in G_v \subseteq N_v$. As $N_v \subseteq M_v$, $x_v \in G_v \subseteq M_v$. M_v is hence VR G -Nbd of x_v . Thus $M_v \in \text{VR G -Nbd}(x_v)$.

(iv) Consider $N_v \in \text{VR G -Nbd}(x_v)$ and let $M_v \subseteq N_v(x_v)$. According to the specification of VR G -Nbd, VR G open sets G_{v1} and G_{v2} such as $x_v \in G_{v1} \subseteq N_v$ and $x_v \in G_{v2} \subseteq M_v$. So $x_v \in G_{v1} \cap G_{v2} \subseteq N_v \cap M_v$ (*). Because $G_{v1} \cap G_{v2}$ is a VR G open set, follows from (*) that $N_v \cap M_v$ is a VR G - Nbd of x_v . Hence $N_v \cap M_v \in \text{VR G -Nbd}(x_v)$.

(v) If $N_v \in \text{VR G -Nbd}(x_v)$, then a VR G open set M_v such as $x_v \in M_v \subseteq N_v$ exists. M_v is VR G -Nbd of each of its points since it is a VR G open set. So, $M_v \in \text{VR G -Nbd}(y_v)$ by $y_v \in M_v$.

4. Vague regular α generalized interior (VR α G- Int(A_v))

Definition 4.1: Consider a subset A_v of the vague topological space X_v . The VR G - Int (VR G -

interior) point x_v of A_v is characterized by the vague union of all vague regular generalized open subsets of A_v . So $VRG - Int(A_v) = \{G_v: G_v \text{ is VRGOS, } G_v \subseteq A_v\}$

Theorem 4.2: Consider a subset A_v of X_v . Then $VRG - Int(A_v) = \{G_v: G_v \text{ is VR}\alpha\text{GOS, } G_v \subseteq A_v\}$

Proof: Let X_v be a vague topological space and let a subset $A_v \subseteq X_v$.

$x_v \in VRG - Int(A_v)$ a VRG interior point x_v of A_v

A_v is VRG - Nbd of x_v .

a VRGOS G_v such as $x_v \in G_v \subseteq A_v$.

$x_v \in \{G_v: G_v \text{ is VRGOS, } G_v \subseteq A_v\}$. Thus $VRGOS - Int(A_v) = \{$

$G_v: G_v \text{ is VRGOS, } G_v \subseteq A_v\}$.

Theorem 4.3: Consider A_v & B_v be a vague subsets of a vague topological space X_v . Then

(i) $VRG - Int(X_v) = X_v$ & $VRG - Int(\emptyset) = \emptyset$.

(ii) $VRG - Int(A_v) \subseteq A_v$.

(iii) If B_v is any VRGOS $\subseteq A_v$, then $B_v \subseteq VRG - Int(A_v)$.

(iv) If $A_v \subseteq B_v$, then $VRG - Int(A_v) \subseteq VRG - Int(B_v)$.

(v) $VRG - Int(VRG - Int(A_v)) = VRG - Int(A_v)$.

Proof: (i) As the VRG open sets are X_v and \emptyset , by the above Theorem 4.2 $VRG - Int(X_v) = \{G_v: G_v \text{ is VRGOS, } G_v \subseteq X_v\} = X_v$ {set of all VRGOS} $\subseteq X_v$ and $VRG - Int(\emptyset) = \emptyset$.

ii) We take $x_v \in VRG - Int(A_v)$. $\Rightarrow x_v$ is an interior point of A_v . $\Rightarrow A_v$ is a Nbd of x_v .

$\Rightarrow x_v \in A_v$. Thus, $x_v \in VRG - Int(A_v)$. Hence $VRG - Int(A_v) \subseteq A_v$.

(iii) Let us consider a VRGOS B_v such that $B_v \subseteq A_v$ and $x_v \in B_v$. Since B_v is a VRGOS contained in A_v , x_v is VRG - Int of A_v . i.e. $x_v \in VRG - Int(A_v)$. Thus $B_v \subseteq VRG - Int(A_v)$.

(iv) $VRG - Int(A_v)$ is the largest VRGOS containing A_v . Since $B_v \subseteq A_v$, $VRG - Int(B_v)$ is the union of all VRGOS containing B_v . Hence $VRG - Int(A_v) \subseteq VRG - Int(B_v)$.

(v) Since $VRG - Int(A_v)$ is VRGOS. Clearly $VRG - Int(VRG - Int(A_v)) = VRG - Int(A_v)$.

Theorem 4.3: If A_v is VRGOS, then $VRG - Int(A_v) = A_v$.

Proof: Consider A_v is a VRGOS of X_v . We Know That $VRG - Int(A_v) \subseteq A_v$. Further VRGOS contained in A_v . By theorem we have $A_v \subseteq VRG - Int(A_v)$. Thus $VRG - Int(A_v) = A_v$.

Theorem 4.4: $VRG - Int(A_v \cup B_v) = VRG - Int(A_v) \cup VRG - Int(B_v)$.

Proof: WKT $A_v \subseteq A_v \cup B_v$ & $B_v \subseteq A_v \cup B_v$. By above theorem we have $VRG - Int(A_v) \subseteq VRG - Int(A_v \cup B_v)$, $VRG - Int(B_v) \subseteq VRG - Int(A_v \cup B_v)$. Hence $VRG - Int(A_v) \cup VRG - Int(B_v) \subseteq VRG - Int(A_v \cup B_v)$.

Theorem 4.5: $VRG - Int(A_v \cap B_v) = VRG - Int(A_v) \cap VRG - Int(B_v)$.

Proof: WKT $A_v \cap B_v \subseteq A_v$ & $A_v \cap B_v \subseteq B_v$. We have $VRG - Int(A_v \cap B_v) \subseteq VRG - Int(A_v)$ and $VRG - Int(A_v \cap B_v) \subseteq VRG - Int(B_v)$. This implies that $VRG - Int(A_v \cap B_v) \subseteq VRG - Int(A_v) \cap VRG - Int(B_v)$. (*)

Let $x_v \in VRG - Int(A_v) \cap VRG - Int(B_v)$. Then $x_v \in VRG - Int(A_v)$ and $x_v \in VRG - Int(B_v)$.

Hence each of sets A_v and B_v having the VRG - Int point x_v . So A_v & B_v is VRG - Nbd of x_v , $A_v \cap B_v$ is also VRG - Nbd of x_v . Thus $x_v \in VRG - Int(A_v \cap B_v)$. Therefore, $VRG - Int(A_v) \cap VRG - Int(B_v) \subseteq VRG - Int(A_v \cap B_v)$ (**). From (*) and (**), $VRG - Int(A_v \cap B_v) = VRG - Int(A_v) \cap VRG - Int(B_v)$.

Conclusion:

This paper is proposed a new class of interior, closure and neighbourhood like VRG - Int and VRG - Nbd in vague topological spaces. Several properties and characterizations are discussed. Further these concepts can be expanded to the future work like connectedness and compactness.
